NinjaOne Ad Hoc Dashboard Setup

What This Does

Automatically generates comprehensive reports as Knowledge Base articles showing relevant statuses and actionable recommendations.

Prerequisites

PowerShell 7 Required

The automation device must have PowerShell 7 or higher installed.

```
# Check version: $PSVersionTable.PSVersion    # Install if needed: winget install --id
Microsoft.PowerShell --source winget
```

Or download from: https://aka.ms/powershell-release?tag=stable

Step 1: Create API Credentials

Navigate to: **Administration → Apps → API**

Click **Add** to create a new API application:

Setting	Value
Application Platform	✓ API Services (machine-to-machine)
Name	API Server (or any name you prefer)
Redirect URIs	Leave blank (not required for machine-to-machine)
Scopes	✓ Monitoring ✓ Management

Allowed Grant Types	✓ Authorization code - CHECK THIS ✗ Client credentials – Leave unchecked ✗ Refresh token - Leave unchecked

⚠️ **Important:** After clicking Add, you'll receive a Client ID and Client Secret. Copy both immediately - the secret cannot be retrieved again!

Step 2: Create Custom Fields

Navigate to: **Administration → Devices → Custom Fields**

Create these three fields at the **Organization** or **Global** level:

Field Name	Type	Automation Permission
ninjaoneClientId	Text	Read/Write
ninjaoneClientSecret	Secure	Read/Write
ninjaoneInstance	Text	Read/Write

Note: Field names are case-sensitive and must match exactly as shown above.

Step 3: Populate Custom Fields

Select the device that will run the automation, then go to **Custom Fields** tab:

Field	Enter Your Value
ninjaoneClientId	Paste the Client ID from Step 1
ninjaoneClientSecret	Paste the Client Secret from Step 1
ninjaoneInstance	Your tenant domain (see examples below)

⚠️ **Important:** Do NOT include https:// or http:// in the instance field. Enter only the domain name.

Example Tenant Domains:

- app.ninjarmm.com
- eu.ninjarmm.com
- us2.ninjarmm.com
- acmetech.rmmservice.ca
- oc.ninjarmm.com

Use the domain you see in your browser address bar when logged into NinjaOne (without the https:// prefix)

Step 4: Add Script to Library

Navigate to: **Administration → Library → Automation**

Click **Add → New Script**

Setting	Value
Name	<Dashboard Type> Dashboard (e.g. Patch Operations Dashboard)
Category	Reporting
Language	PowerShell
Operating System	Windows
Architecture	All

Paste the entire PowerShell script content (provided separately) and click **Save**.

Script Variables (Optional Parameters)

The script supports the following optional variables that can be configured when running the script:

Report Type	Variable Name	Type	Description
All	Report Month	String/Text	Target a specific month for reporting. Format: "June 2025"
All	URLOverride	String/Text	Override the default instance URL for specific use cases
Patch	KBSpotlight	String/Text	Comma-separated list of KB numbers to highlight in reports (e.g., "KB5043878, KB5044285")

Software	Blacklist	String/Text	Comma-separated list of Application names to highlight in reports (e.g. Spotify)
Software	includeDrivers	CheckBox	Include drivers, firmware, and hardware-related software in inventory

Note: These parameters are optional and vary depending on the specific Dashboard implemented. If you have questions, consult NinjaOne for more information. If unspecified, the script will use default values (the current month/year for Report Month, no custom field value for URL, etc).

Step 5: Run the Dashboard

Manual Test Run:

1. Go to Devices and select your automation device
2. Click Actions → Run Script
3. Select <Dashboard Type> Dashboard
4. Click Run

Schedule Monthly Runs:

1. Go to Administration → Policies
2. Edit your policy → Automation → Scheduled Scripts
3. Add the dashboard script to run monthly (e.g., 1st of month at 2:00 AM)

✓ **Success!** After the script runs, check Knowledge Base → Monthly Reports for your generated dashboards.

View Your Reports

Location: Knowledge Base → Monthly Reports

You'll Find:

- Global Report: <Dashboard Type> - All Organizations - [Month Year]
- Per-Org Reports: <Dashboard Type> - [Organization Name] - [Month Year]

Each Report Includes Some of the Following:

- Executive summary with KPIs
- Compliance trends vs previous month
- Patch deployment effectiveness

- Priority action items
- OS distribution charts
- Device-level compliance details

Troubleshooting

Issue	Solution
"PowerShell 7 is required"	Install PowerShell 7 on the automation device
"Missing API credentials"	Verify custom field names match exactly and are populated
No reports generated	Check API scopes include Monitoring and Management
"Access Denied" errors	Regenerate API credentials with correct grant types
